

What is CMDB?

Configuration Management DataBase

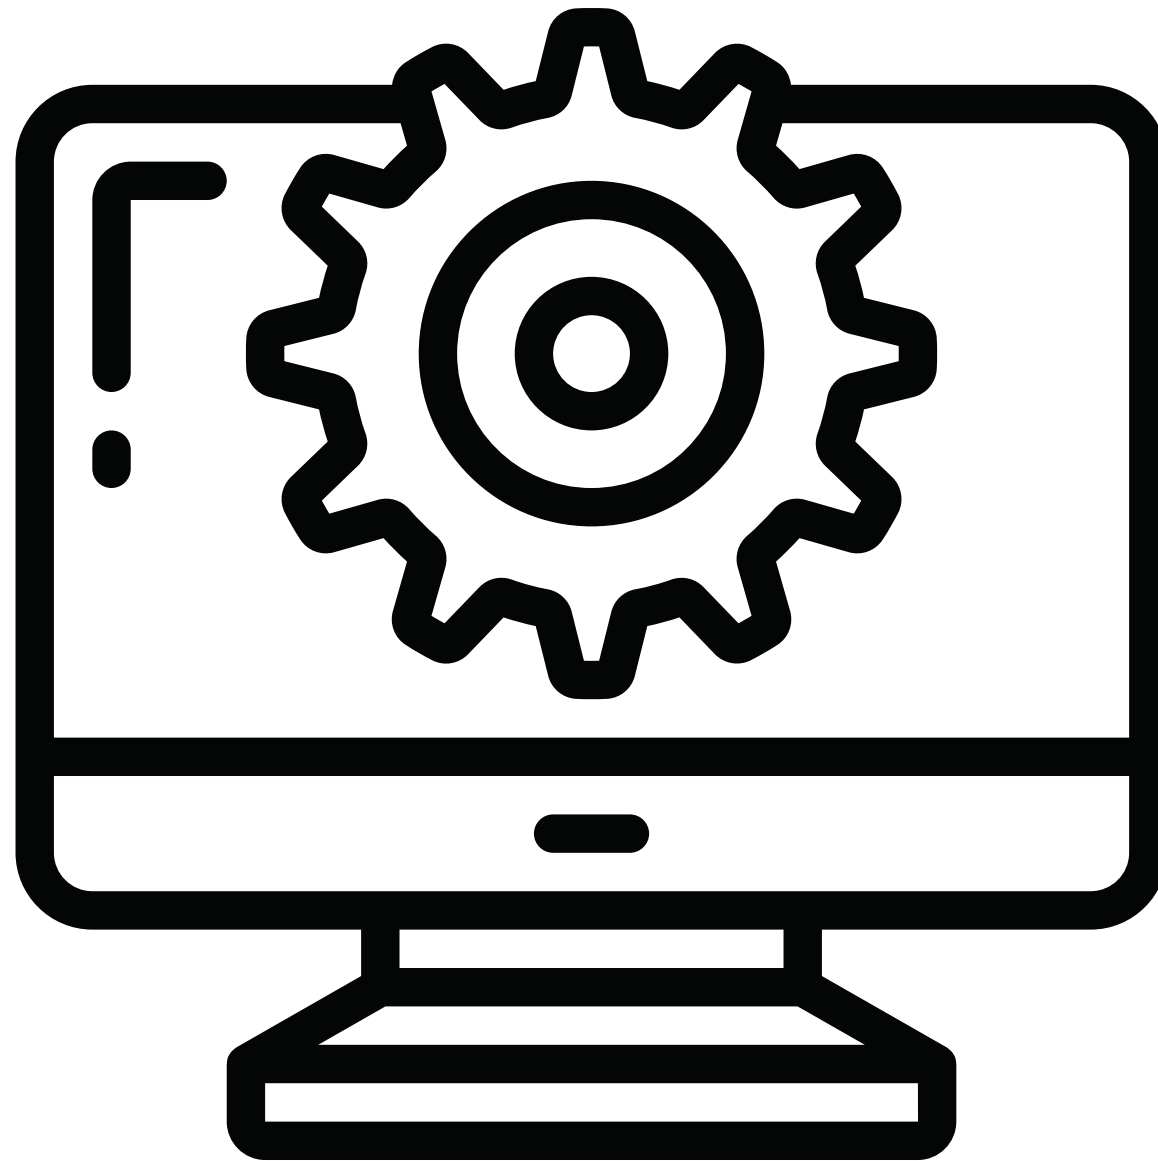

Database to Keep Track of IT assets and configuration items and how they are configured to provide value to the company.

"A Single source of Truth"

What is CI?

Configuration Item

- Fundamental structural unit of CMDB
- Stored in CMDB
- Component managed in order to deliver IT Services
- Can be physical entity, logical entity or conceptual

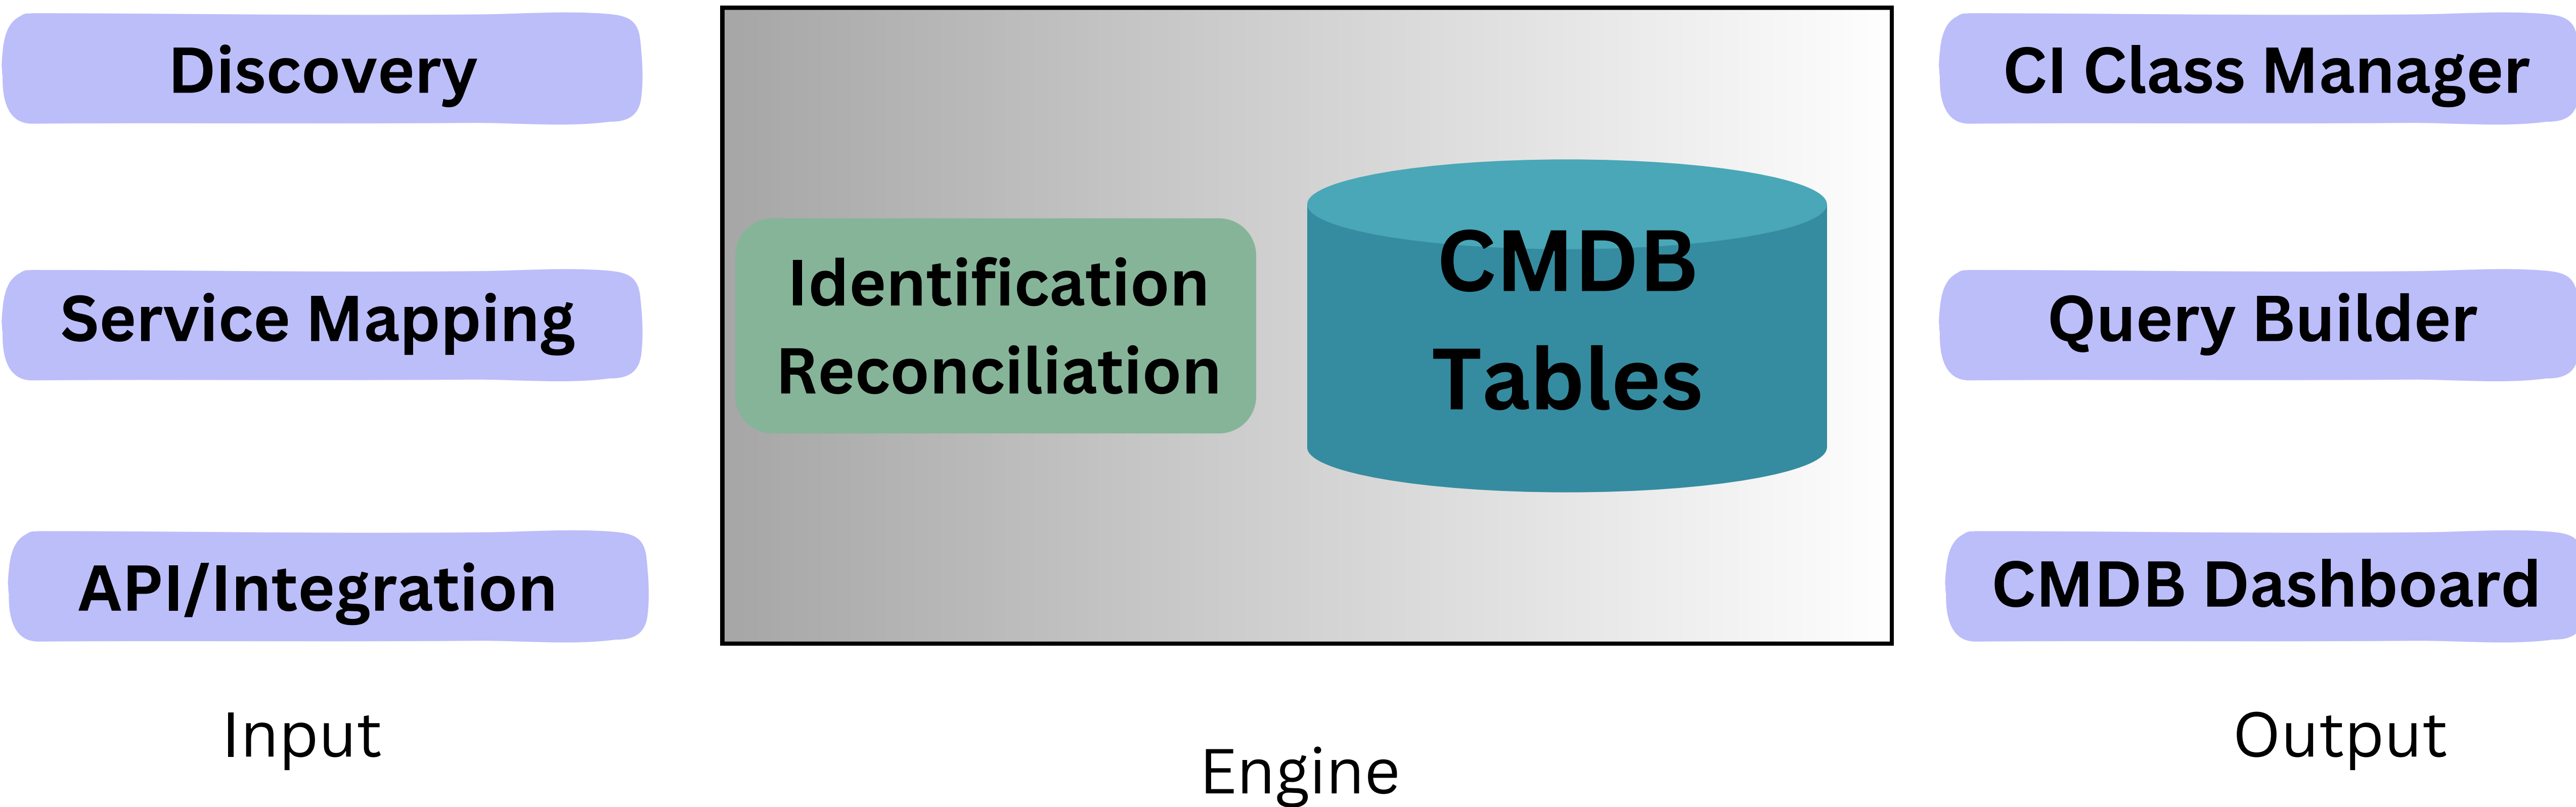

Example: *Computer, Database Instance, Service*

CMDB Tables (important)

- Base Configuration Item (**cmdb**) table - Base table in CMDB. Parent table of cmdb_ci.
- Configuration Item (**cmdb_ci**) table - Has basic fields/attributes for all CIs.
- CI Relationship (**cmdb_rel_ci**) table - Define relationships between CIs.

CMDDB Architecture

CI Relationship

A CI Relationship is connection or link between CIs. Shows how CIs are related or dependent on each other.

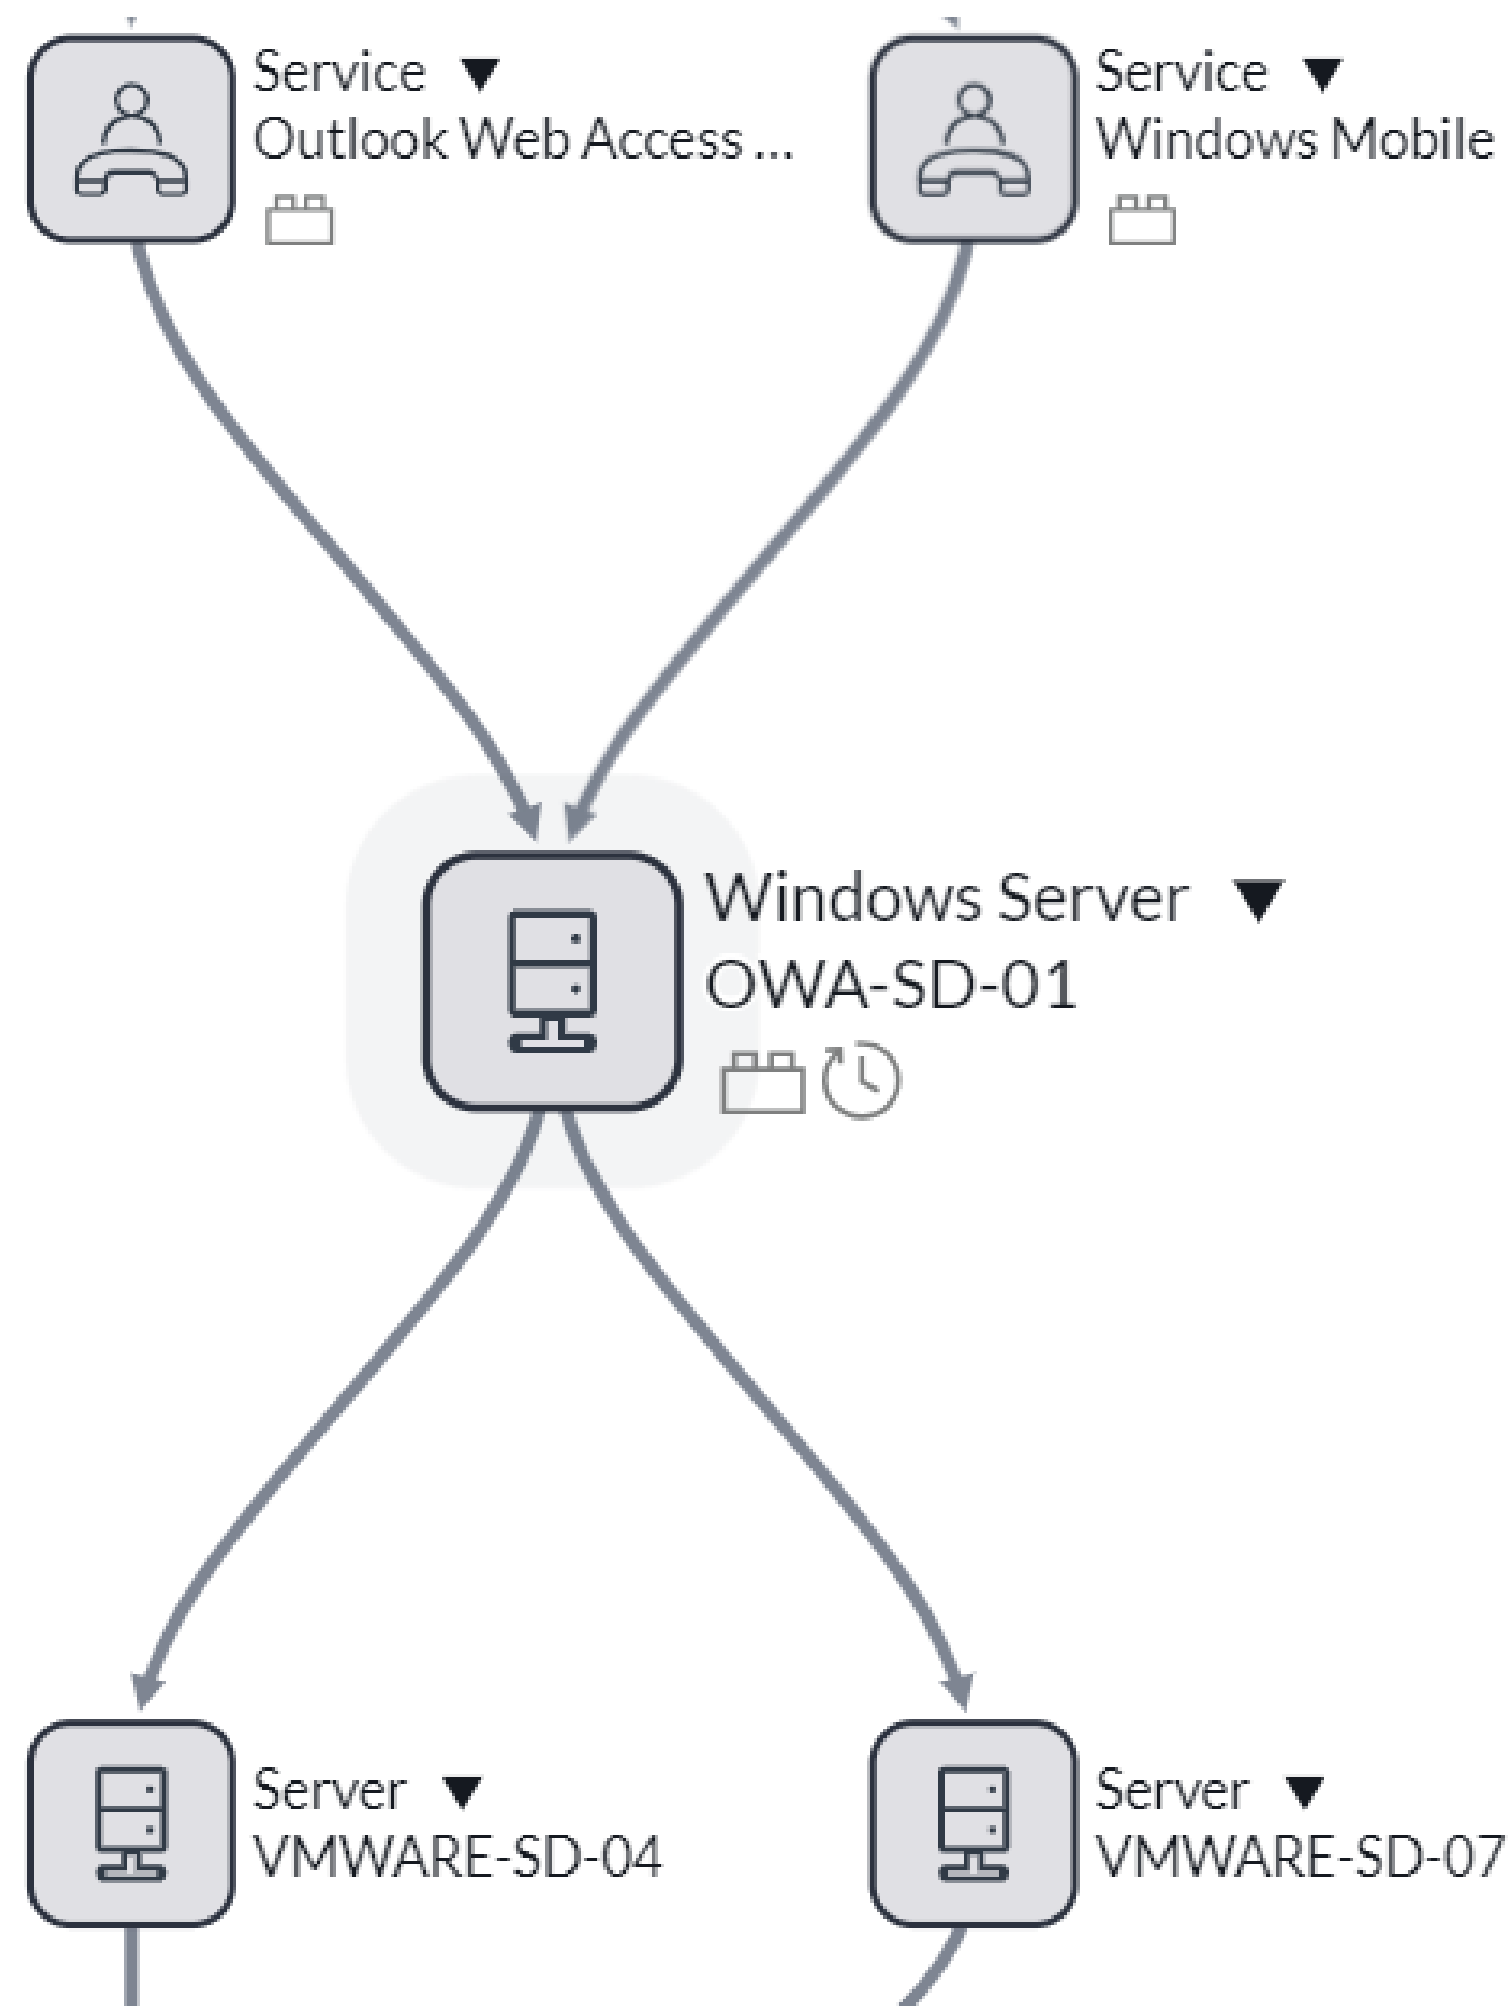

A Relationship in CMDB is consist of following:

- Parent CI
- Child CI
- Relationship Type

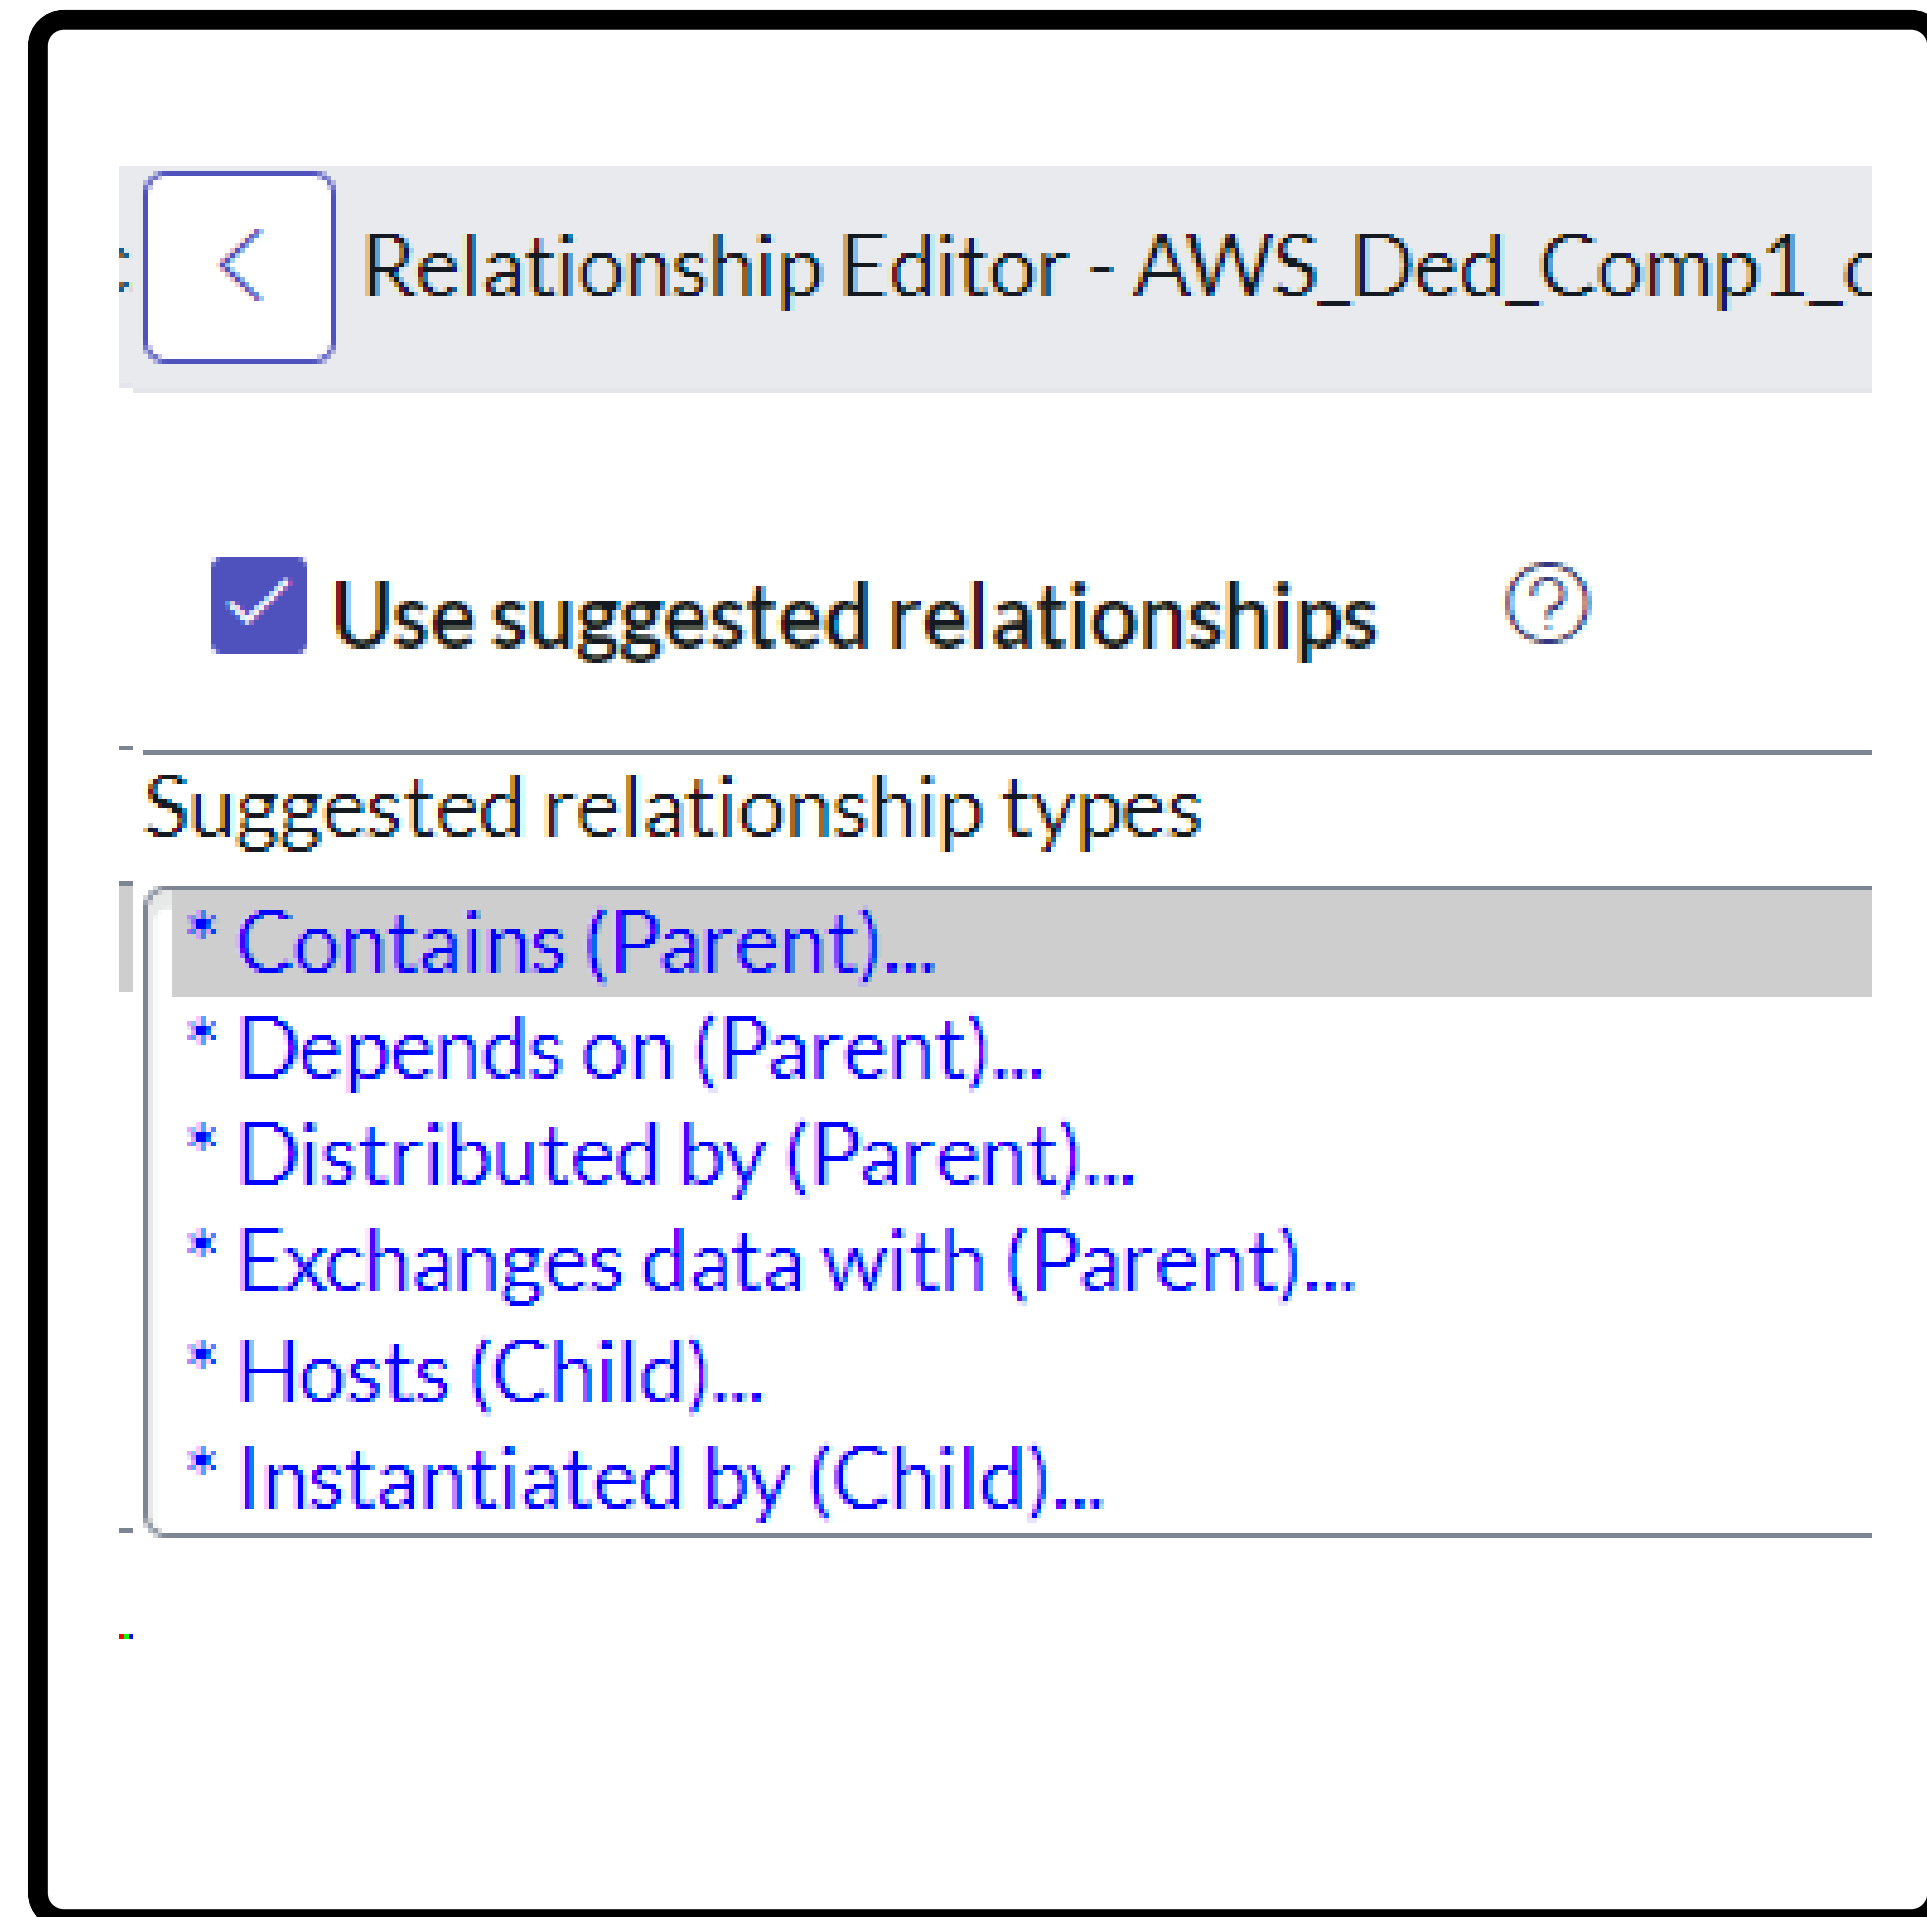

Setting for Relationship view on form page

- Layout (Flat/Tree, Split/Merge)
- Filter By Max Level
- Upstream/Downstream Relationship

Follow on

Relationship Editor

- View, Create, Modify or Delete CI Relationships
- Use suggested relationship to select reasonable relationships for configuration items.
- System keeps a table of relationship types **cmdb_rel_type_suggest** that are appropriate for a CI type, based on its class.
